Memory Expansion for the Data Center

The digital economy has created significant demands for both real-time and batch processing of large data sets. IT organizations across the world are leveraging in-memory computing to drive superior application performance and obtain meaningful insights through the use of advanced business analytics.

However, in-memory computing can become bottlenecked by set limitations on the amount of memory available to the server, as well as prohibitive DRAM pricing.

Ultrastar® DC ME200 Memory Extension Drive can be used to scale existing system memory, promote server consolidation, and reduce the complexity of splitting large multi-TB data sets across multiple servers. Ultrastar memory drive provides applications with large amounts of system memory at a fraction of the cost of DRAM. Advanced software algorithms work to maintain near DRAM-like performance across a variety of applications, especially targeting highly parallel workloads with high numbers of transactions. Once installed, the solution is transparent, requiring no changes to the existing OS and application stacks.

Dramatically Scale System Memory

Web application caching in particular requires large amounts of system memory to quickly ingest and analyze vast streams of data from Internet users, transaction events, and IoT devices. High concurrency environments, such as virtualized servers and container-based applications, are prime examples where memory usage can quickly outpace processing capabilities, requiring expensive additional scale-out servers to house the extra memory and virtual machines.

Ultrastar memory drive allows for the transparent expansion of system memory, enabling larger data sets to be used for analytics computations, more data to be stored in front-end web caches, and overall more work that can be accomplished within each server.

---

**Highlights**

- Enables scaling of system memory, typically up to 24TiB per 1U server and 96TiB in 4U servers
- Delivers DRAM-like performance for key enterprise applications and workloads*
- Transparent to existing OS and applications
- Promotes server consolidation
- Fits most industry-standard server models

**Applications**

- Business Analytics
- Data Warehousing
- Application Caching
- Server Virtualization
- Container-Based Applications
- Genomics & AI Research
- Real-Time Analysis
- Cloud Services and SaaS
- IoT, Time-Series Analysis

---

*Advanced software algorithms work to maintain near DRAM-like performance across a variety of applications, especially targeting highly parallel workloads with high numbers of transactions. Once installed, the solution is transparent, requiring no changes to the existing OS and application stacks.
### Memory Expansion Example:

#### Baseline
- 1U, 2-socket server
- 24x 64GiB DRAM DIMMs
- 1.5TiB total system memory

#### Config-A (1:8 memory extension)
- 1U, 2-socket server
- 16x 16GiB DRAM DIMMs (256GiB)
- 2x 1TiB ME200 devices
- 2TiB total system memory

#### Config-B (1:8 memory extension)
- 1U, 2-socket server
- 24x 16GiB DRAM DIMMs (384GiB)
- 3x 1TiB ME200 devices
- 3TiB total system memory

### Use-Case Scenarios:
- **Configuration A** in Figure 2 on the left shows that reducing DRAM from 1.5TiB to 256GiB and adding two 1TiB Ultrastar memory drive devices can reduce total system cost by 35% and provide applications with 33% more memory.
- **Configuration B** in Figure 2 shows that by reducing DRAM from 1.5TiB to 384GiB and adding three 1.5TiB Ultrastar memory drive devices, you can reduce TCO system cost by 10%, while providing applications with 100% more memory.
- Both Configuration-A and Configuration-B in Figure 2 showcase how Ultrastar memory drive enables server consolidation by allowing for the increase in size of data sets that can be handled within a single server, thereby reducing the total number of servers, application licenses, and associated OPEX and CAPEX costs.

### Figure 3
- A performance example using Memcached, typically used in content caching applications. Total system memory as seen by the application in all three instances is 768GiB. The first bar represents the full amount of system memory in native DRAM. The second and third bars show the same workload run using less DRAM plus Ultrastar memory drive in a 1:4 memory extension ratio and 1:8 memory extension ratio. The application is able to maintain 91% performance* and 85% performance* respectively, compared to running in DRAM alone.

### Specifications

### Hardware Specifications

- Form Factor / Interface: U.2 15mm, PCIe Gen3 AIC HH-HL
- Power Requirement (DC +/-5%) 3.3V (aux) and 12V
- Operating Power (typical) 25 watts active, 9 watts idle
- Operating Temperature (ambient) U.2: 0°C–70°C Ambient, AIC: 0°C–55°C Ambient
- Endurance (PBW)* 1 TiB model: 19.1, 2 TiB model: 38.2, 4 TiB model: 78.4
- Limited Warranty* 5 years

* Memory capacity is indicated by GiB and TiB and based on binary values such that one gibibyte (GiB) is equal to 2^40 bytes and one tebibyte (TiB) is equal to 2^40 GiB = 2^40 bytes. Storage capacity and endurance is indicated by TB and PB where one PB equals 1,000TB. Accessible capacity can vary from stated capacity due to software, formatting, and other factors.

* Suggested expansion of 8x DRAM based on internal performance testing across a variety of industry standard benchmarks.

* Endurance rating based on 4KiB random write workload.

* The warranty for the product will expire on the earlier of (i) the date when the flash media has reached one-terabyte (1TB) of its remaining life or (ii) the expiration of the time period associated with the product.

* Results will vary based on application and workload.
